Bubunits and a calcium binding site on its lower surface.";

subunits and a calcium binding site on its lower surface.";

Experimental support for a beta-propeller domain in integrin alpha-Mobeta-2 is implicated in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles.

It is identical with CR-3, the receptor for the iC3b fragment of the third complement component. It probably recognizes the R-G-D peptide in C3b. Integrin alpha-M/beta-2 is also a receptor for fibrinogen, factor X and ICAMI. It recognizes Pl and P2 peptides of fibrinogen gamma chain.

C -1- SUBUNIT: Heterodimer of an alpha and a beta subunit. Alpha-M associates with beta-2.

C -1- SUBCELLULAR LOCATION: Type I membrane protein.

--- TISSUE SPECIFICITY: Predominantly expressed in monocytes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DOMAIN: The integrin I-domain (insert) is a VWFA domain. Integrins with I-domains do not undergo protease cleavage.
SIMILARITY: Belongs to the integrin alpha chain family.
SIMILARITY: Contains 7 FG-GAP repeats.
SIMILARITY: Contains 1 WPFA domain.

as well as in mediating the uptake of complement-coated particles. It is identical with CR-3, the receptor for the iC3b fragment of the third complement component. It probably recognizes the R-G-D peptide in C3b. Integrin alpha-M/beta-2 is also a receptor for fibrinogen, factor X and ICAM1. It recognizes Pl and P2 peptides of fibrinogen gamma chain. Alpha-M/beta-2 play a critical role in mast call development and in immune complex-mediated glomerulonephritis. Mice expressing a null mutation of the alpha-M subunit gene demonstrate increase in neutrophil accumulation, in response to a impaired degranulation and phagocytosis, events that apparently accelerate apoptosis in neutrophils. These mice develop

"Cloning of rat alpha D, a novel beta 2 integrin.";

"Cloning of rat alpha D, a novel beta 2 integrin.";

"Cloning of rat alpha D, a novel beta 2 integrin.";

"Cloning of rat alpha D, beta-2 is a receptor for ICAM3 and ACAM1. May play a role in the atherosclerotic process such as clearing lipoproteins from plaques and in phagocytosis of bloddborne pathogens, particulate matter, and senescent erythrocytes from the blood (By similativy).

"C -1- SUBUNIT: Heterodimer of an alpha and a beta subunit. Alpha-D associates with beta-2 (By similarity).

"C -1- SUBCELLULAR LOCATION: Type I membrane protein (By similarity).

"I - DOMAIN: The integrin I-domain (insert) is a vwFA domain. Integrins with I-domains do not undergo procease cleavage.

"I - SIMILARITY: Contains I VWFA domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. "Genomic structure of an integrin alpha subunit, the leukocyte p150,95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DOWAIN: The integrin I-domain (insert) is a VWFA domain. Integrins with I-domains do not undergo protease cleavage.
SIMILARITY: Belongs to the integrin alpha chain family.
SIMILARITY: Contains 7 FG-GAP repeats.
SIMILARITY: Contains 1 VWFA domain.

"Prediction of the Coding Sequences of Mouse Homologues of FLJ Gente:
The Complete Nucleotide Sequences of 110 Mouse FLJ-homologous cDNÄs Identified by Screening of Terminal sequences of cDNA Clones Randomly Sampled from Size-Fractionated Libraries.";

Submitted (FEB-2004) to the EMBL/GenBank/DDBJ databases.

Isolation of genes selectively expressed by dendritic cells.";
Committed (DEC-1999) to the EMBL/GenBank/DbBJ databases.
Interaction interaction alpha=x/beta=2 is a receptor for fibrinogen. It recognizes the sequence G-P-R in fibrinogen. It mediates cell-cell interaction during inflammatory responses. It is especially important in monocyte adhesion and chemotaxis (By similarity).

Committed in a light and a beta subunit. Alpha=X associates with beta=2 (By similarity).

Committed in a light and a beta subunit. Alpha=X associates with beta=2 (By similarity).

Committed in integrin I chamin (insert) is a VWFA domain. Integrins with I-domains do not undergo protease cleavage.

Committed in a VMFA domain (insert) is a VMFA domain family.

Committed in a VMFA domain.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

call or part of a variant integrin alpha subunit A domain or a variant integrin beta subunit A-like domain. The polypeptide, preferably the Collb alpha subunit A domain, where I at residue 312 has been replaced by G or A, F at residue 313 and A at residue 320 have been replaced by C, or V at residue 315 and A at residue 320 have been replaced by C, or V at residue 315 and A at residue 320 have been replaced by C, or C decermining if a test compound is a candidate compound for binding to CD11b or for treating an inflammatory disorder, by contacting a test compound with the polypeptide and determining if the test compound binds to the polypeptide. The integrin subunits are useful for reducing shelteral muscle injury, for treating disorders caused by ischaemia.

The purify variant integrin polypeptide ligands and as bait proteins in the public or three-hybrid assays. This sequence represents a human integrin alpha subunit CD11b deletion variant. A domain. Note: This variant sequence is not featured in the specification but has been derived from the wild-type protein shown in AAU76847

```
complement activity in vitro. The analogue is generated by substituting a short consensus repeat domain (SCR) or a von Willebrand Factor domain (SCR) or a von Willebrand Factor domain as to thuman factor B with a SCR or a vwF from a second protein such as thuman C2 or CR3. The analogues may be used to regulate the complement system involved in immune and autoimmune responses. Complement activity can account for substantial tissue damage in a wide variety of autoimmune (SCR) immune complex mediated syndromes such as lupus erythematosus, inhibition of intervention in these cases. Inhibition of complement may also be favorable in cases that involve tissue damage caused by vascular calso be favorable in cases that involve tissue damage caused by vascular and of the destruction of partially damaged tissue as in contribute to the destruction of partially damaged tissue as in creperfusion injury. In addition, the use of complement system may contribute to the destruction of partially damaged tissue as in creperfusion injury. In addition, the use of complement analogues with conversing a sites of inflammation. Complement inhibition is important in the prevention of xenopalement by cell-associated and soluble inhibitors is useful in protecting the transplant from damage caused by activation of complement. The present sequence represents the vWF domain of human factor MAC-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       요
                                                                                                                                                                                                                                          The invention relates to a novel isolated or recombinant modified integrin protein having extracellular domains of integrin alpha and beta subunits where one of the subunits has one or more mutations, an altered surface feature or an amino acid substitution or internal deletion, extracellular domains of the integrin beta subunit that comprise a mutation that alters a non-cysteine residue to cysteine or extracellular domains of integrin alpha and beta subunits. The polypeptide of the invention demonstrates antipsoriatic, thrombolytic, anticoagulant, osteopathic, cytosteatic, immunosuppressive, antiinflammatory, neuroprotective and antisickling activities and may be useful for immunotherapy in order to prevent or treat an integrin-mediated disorder such as an inflammatory disorder, an autoimmune disorder, thrombosis, cancer, osteoporosis, sickle cell anaemia, psoriasis and multiple sclerosis. The current sequence is that of the human integrin alpham such an unit precursor protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                     Novel modified integrin protein having extracellular domains of integrin alpha and beta subunits or integrin alphaII and beta3 subunit, useful for treating integrin mediated disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  144 CPQEDSDIAFLIDGSGSIIPHDFRRMKEFVSTVMEQLKKSKTLFSLMQYSEEFRIHFTFK 203

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, and individual. The method is also useful in assessing the immune status of an individual. The method is also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

Mac-1 alpha subunit is involved in the response to inflammation, i.e. recognition of and migration to sites of inflammation. It also attaches to cellular substrates as part of this function making it useful in visualising endothelial tissue. Mac-1 is a member of the Integrin Gene superfamily. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 2

This sequence represents a human beta-integrin CD11b subunit which is used to describe a method for identifying compounds that modulate the interaction of the beta-integrin alpha-d subunit with a binding partner of alpha-d which involves contacting an alpha-d polypeptide with an alpha labelled, in the presence of a test compound, and determining if the compound affects binding between the alpha-d polypeptide and alpha-d comprising the cytoplasmic, transmembrane or extracellular domain of alpha-d. Comprising the cytoplasmic, transmembrane or extracellular domain of alpha-d. Compounds that modulate alpha-d binding could be used to treat diseases such as type-I diabetes, atherosclerosis, multiple sclerosis, asthma, psoriasis, lung inflammation, acute respiratory distress syndrome and rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

This invention relates to a modified integrin-I or integrin I-like domain polypeptide comprising at least one disulfide bond so that the domain stabilised in a desired conformation. The polypeptide of the invention may have antiinflammatory or immosupcessive activities. The polypeptides of the invention have an open conformation and are useful as immunogens to produce antibodies that selectively bind to integrin I-domain; and for identifying a modulator of integrin activity, or of interaction of an integrin and a cognate ligand. The polypeptide of the invention, or antibodies (preferably anti-LFA-1 antibody) is useful for transmitting an integrin mediated disorder which is an inflammatory or autoimmune disorder in a subject and for inhibiting the binding of an integrin to a cognate ligand such as Crohn's disease, nephritis; human immunodeficiency virus (HIV), myocardial infarction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified integrin-I or integrin I-like domain polypeptide useful as a immunogen to produce antibodies specific to polypeptide, comprises a disulfide bond such that polypeptide is stabilized in a desired

Integrins are a class of membrane-associated molecules that participate in cellular adhesion. Integrins are made up of an alpha subunit and a beta subunit. One class of human integrins are restricted to expression in white blood cells and have an integrins. Leu-CAMS, leukointegrins or beta2 subunit: the leukocyte integrins. Leu-CAMS, leukointegrins or beta2 integrins. Beta2 integrins have an important role in immune and inflammatory responses. The present protein sequence is the human integrin alpha subunit CD11b. This sequence responsing in a alignment to identify a novel beta2 integrin alpha sequence has approximately 60% identity to the protein sequence has approximately 60% identity to the protein sequence of alpha d. The caberrant alpha d function engory protein sequence of alpha d. The aberrant alpha d function engory inflammation, acute respiratory clatress syndrome, rheumatoid arthritis and leukocyte adhesion deficiency (LAD). In addition, anti-alpha d monoclomal antibodies may be used in the inflation of macrophage infiltration at the site of a central nervous system injury. The monoclomal antibodies can also be used to detect and

diagnose Crohn's disease

Sequence 1153 AA;

Example 5; Fig 1; 270pp; English.

```
Sjorgen's syndrome, rheumatoid arthritis, dermatitis. A therapeutic composition comprising the peptide of the invention is useful for treating an integrin mediated disorder in a subject. The polypeptides and/or active or antigenic fragments are useful as reagents for diagnosis of integrin-mediated disorders. The present sequence represents the human integrin-l alpha-M protein subunit used to generate the mutant polypeptides of the invention

The invention relates to promoting locomotor recovery, inhibiting locomotor damage, limiting locomotor impairment, or limiting autonomic and sensory dysfunction following spinal cord injury by administering an anti-alpha d (Beta2 integrin alpha2 subunit) monoclonal antibody to a spinal cord injury victim. The method also involves the use of a ligand

Use of an anti-alpha-d monoclonal antibodies for promoting locomotor recovery, inhibiting locomotor damage, limiting locomotor impairment, or limiting autonomic and sensory dysfunction following spinal cord injury.

selected from ICAM-R or VCAM-1 (intracellular cell adhesion molecule, vascular cell adhesion molecule). The method is useful for promoting locomotor recovery, inhibiting locomotor damage, limiting locomotor impairment, or limiting autonomic and sensory dysfunction following spinal cord injury. In particular, the spinal cord injury comprises compression of the spinal cord. The antibodies are also useful for reducing inflammation at the site of a central nervous system injury. The specification also details the identification of Beta2 integrin alphaD cobns and proteins, for use in raising the antibodies. Beta2 integrins are implicated in diseases such as LAD (leukocyte adhesion deficiency, inflammatory response, diabetes, multiple sclerosis, arthritis, graft atherosclerosis, inflammatory bowel disease, Crohn's disease, ulcerative colitis, immune complex alveolitis and leukaemia. The present sequence is a Beta2 integrin alpha subunit sequence included for comparison with the

The invention relates to a binding domain-immunoglobulin fusion protein comprehence a binding domain polypeptide, an immunoglobulin hinge region polypeptide, an immunoglobulin heavy chain (FR constant region polypeptide that is fused to the hinge region polypeptide that is fused to the CH2 constant region polypeptide. The hinge region polypeptide comprises: a wild-type human iggli immunoglobulin hinge region polypeptide comprises: a wild-type human iggli immunoglobulin hinge region polypeptide. The mutated human iggli immunoglobulin hinge region polypeptide comprises: a wild-type human iggli immunoglobulin hinge region polypeptide contains contains 2 cysteine residues, where the first cysteine is not mutated; human iggli immunoglobulin hinge region polypeptide contains of mutated human iggli immunoglobulin hinge region polypeptide contains contains and a mutated human iggli immunoglobulin hinge region polypeptide contains or cysteine residues; where the first cysteine residues, where the first cysteine residues and a mutated human iggli immunoglobulin hinge region polypeptide contains or cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains or cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains or cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains or cysteine residues. The binding domain-immunoglobulin fusion protein, a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein, a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein, a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein is useful for treating a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein equanced at an isolated with a recombinant and condition or an abected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumoglobulin fusion protein-associa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 BFQNNPNPRSLVKPITQLLGRTHTATGIRKVVRELFNITNGARKNAFKILVVITDGEKFG 120
                                                   New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 CPQEDSDIAFLIDGSGSIIPHDFRRMKEFVSTVMEQLKKSKTLFSLMQYSEEFRIHFTFK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                domain proteins, wherein the alterations to the protein curegin inserted (1) proteins, wherein the alterations to the protein occur in at least two noncontinuous regions. Specifically the the variant integrin I domain proteins are structurally bissed to exist in the open conformation, thereby altering the binding ability of the protein. The invention also comprises nucleic acids encoding the variant integrin I domain proteins and nucleic acids are useful for treating. Preventing or suppressing integrin related inflammatory and immunological disorders (e.g. rheumatoid arthritis). The variant integrin I domain proteins and nucleic acids can also be used for treating, reperfusion (e.g. hypovolemic shock); infarction; cerebral shock; viral infection; and cancer. The variant integrin I domain nucleic acids and proteins may be used in gene therapy, as vaccines and to screen for alpha subunit of integrin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Binding domain; immunoglobulin; fusion protein; cytostatic; antiarthritic; immunosuppressive; antidiabetic; antithyroid; neuroprotective; hinge region; famunoglobulin heavy chain; CH2 constant region; CH3 constant region, IgG1, antibody dependent cell-mediated cytotoxicity; ADCC; complement fixation; antibody dependent conflictor; B-cell disorder; melanoma; carcinoma; sarcoma; rheumatoid arthritis; myaethenia gravis; Grave's disease; type I diabetes mellitus; multiple sclerosis; autoimmune disease.

The invention relates to a high affinity integrin polypeptide comprising all or part of a variant integrin alpha subunit A domain or a variant integrin beta subunit A-like domain. The polypeptide, preferably the CD11b alpha subunit A-like domain. The polypeptide, preferably the CD11b alpha subunit A domain, where I at residue 312 has been replaced by G or A, F at residue 313 and A at residue 320 have been replaced by C, or for a residue 313 and A at residue 320 have been replaced by C, or for determining if a test compound is a candidate compound for binding to CD11b or for treating an inflammatory disorder, by contacting a test compound with the polypeptide and determining if the test compound binds to the polypeptide. The integrin subunits are useful for reducing skeletal muscle injury, immune complexes, restenses and parasitic diseases, reperfusion injury, immune complexes, restenses and parasitic diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; integrin alpha subunit; A domain; CD11b; integrin beta subunit; A-like domain; inflammactory disorder; skeletal muscle injury; restenosis; ischaemia-reperfusion injury; immune complex; parasitic disease; mutant; antiinflammatory; vasotropic; antiparasitic; vulnerary; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel high affinity integrin polypeptide useful for treating restenosis and parasitic diseases, comprises all or part of variant integrin alpha subunit A domain or variant integrin beta subunit A-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to purify variant integrin polypeptide ligands and as bait proteins in two-hybrid or three-hybrid assays. This sequence represents a human integrin alpha subunit CD11b variant A domain. Note: This variant sequence is not featured in the specification but has been derived from the wild-type protein shown in AAU76847

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a high affinity integrin polypeptide comprising all or part of a variant integrin alpha subunit A domain. The polypeptide, preferably the CD11b alpha subunit A-like domain. The polypeptide, preferably the CD11b alpha subunit A domain, where I at residue 312 has been replaced by G or A, F at residue 313 and A at residue 320 have been replaced by C, or V at residue 315 and A at residue 320 have been replaced by C, or V at residue 315 and A at residue 320 have been replaced by C, or V at residue 315 and A at designed 30 have been replaced by C, is useful for determining if a test compound 1s a candidate compound for binding to determining if the test compound binds to the polypeptide and determining if the test compound binds to the polypeptide. The integrin subunits are useful for reducing skeletal muscle injury, for treating disorders caused by ischaemiareperfusion injury, immune complexes, restenosis and parasitic diseases, to purify variant integrin polypeptide ligands and as bait proteins in two-hybrid or three-hybrid assays. This sequence represents the human
                                                                                                  EFONNPNPRSLVKPITQLLGRTHTATGIRKVVRELFNITNGARKNAFKILVVITDGEKFG 120

```
The present invention relates to generating a specific binding partner to a peptide, encoded by a genomic DNA fragment or an expressed sequence tag (EST). A nucleic acid molecule encoding a fusion protein is expressed in a host cell to allow the formation of inclusion bodies comprising the fusion protein, the inclusion bodies are isolated and a specific binding partner is generated. The specific binding partners generated are useful for identifying and characterizing naturally occurring proteins e.g. as immunoglobulins or fragments in immunoassays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genomic

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                    922

Patent No. 5831029

GENERAL INFORMATION:
GALLAINTON:
APPLICANT: Van der Vieren, Monica
TITLE OF INVENTION:
NUMBER OF SEQUENCES: 103
CORRESPONDENCE ADDRESS:
ADDRESSEE: Marshall, O'Toole, Gerstein, Murray & Borun
STREET: 233 South Wacker Drive, 6300 Sear Tower
CITY: Chicago
STATE: Illinois
COUNTY: United States
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
